Vulnerabilities by Host	
• 184.168.115.118	4

184.168.115.118

Host Information

DNS Name: 118.115.168.184.host.secureserver.net

IP: 184.168.115.118
OS: CISCO PIX 7.0

Vulnerabilities

54582 - SMTP Service Cleartext Login Permitted

Synopsis

The remote mail server allows cleartext logins.

Description

The remote host is running an SMTP server that advertises that it allows cleartext logins over unencrypted connections. An attacker may be able to uncover user names and passwords by sniffing traffic to the server if a less secure authentication mechanism (i.e. LOGIN or PLAIN) is used.

See Also

https://tools.ietf.org/html/rfc4422

https://tools.ietf.org/html/rfc4954

Solution

Configure the service to support less secure authentication mechanisms only over an encrypted channel.

Risk Factor

Low

CVSS v2.0 Base Score

2.6 (CVSS2#AV:N/AC:H/Au:N/C:P/I:N/A:N)

Plugin Information

Published: 2011/05/19, Modified: 2021/01/19

Plugin Output

tcp/587/smtp

The SMTP server advertises the following SASL methods over an unencrypted channel on port $587\ :$

All supported methods : LOGIN, PLAIN Cleartext methods : LOGIN, PLAIN

70658 - SSH Server CBC Mode Ciphers Enabled

Synopsis

The SSH server is configured to use Cipher Block Chaining.

Description

The SSH server is configured to support Cipher Block Chaining (CBC) encryption. This may allow an attacker to recover the plaintext message from the ciphertext.

Note that this plugin only checks for the options of the SSH server and does not check for vulnerable software versions.

Solution

Contact the vendor or consult product documentation to disable CBC mode cipher encryption, and enable CTR or GCM cipher mode encryption.

Risk Factor

Low

CVSS v3.0 Base Score

3.7 (CVSS:3.0/AV:N/AC:H/PR:N/UI:N/S:U/C:L/I:N/A:N)

Plugin Output

tcp/22/ssh

```
The following client-to-server Cipher Block Chaining (CBC) algorithms are supported:

aes128-cbc
aes256-cbc

The following server-to-client Cipher Block Chaining (CBC) algorithms are supported:

aes128-cbc
aes256-cbc
```

153953 - SSH Weak Key Exchange Algorithms Enabled

Synopsis The remote SSH server is configured to allow weak key exchange algorithms. Description The remote SSH server is configured to allow key exchange algorithms which are considered weak. This is based on the IETF draft document Key Exchange (KEX) Method Updates and Recommendations for Secure Shell (SSH) RFC9142. Section 4 lists guidance on key exchange algorithms that SHOULD NOT and MUST NOT be enabled. This includes: diffie-hellman-group-exchange-sha1 diffie-hellman-group1-sha1 gss-gex-sha1-* gss-group1-sha1-* gss-group14-sha1-* rsa1024-sha1 Note that this plugin only checks for the options of the SSH server, and it does not check for vulnerable software versions. See Also https://datatracker.ietf.org/doc/html/rfc9142 Solution Contact the vendor or consult product documentation to disable the weak algorithms. Risk Factor Low CVSS v3.0 Base Score 3.7 (CVSS:3.0/AV:N/AC:H/PR:N/UI:N/S:U/C:L/I:N/A:N) CVSS v2.0 Base Score 2.6 (CVSS2#AV:N/AC:H/Au:N/C:P/I:N/A:N) Plugin Information Published: 2021/10/13, Modified: 2024/03/22

Plugin Output

tcp/22/ssh

The following weak key exchange algorithms are enabled : $\label{eq:diffie-hellman-group-exchange-shal} \end{substitute}$

39520 - Backported Security Patch Detection (SSH)

Synopsis
Security patches are backported.
Description
Security patches may have been 'backported' to the remote SSH server without changing its version number.
Banner-based checks have been disabled to avoid false positives.
Note that this test is informational only and does not denote any security problem.

45590 - Common Platform Enumeration (CPE)

Synopsis

It was possible to enumerate CPE names that matched on the remote system.

Description

By using information obtained from a Nessus scan, this plugin reports CPE (Common Platform Enumeration) matches for various hardware and software products found on a host.

Note that if an official CPE is not available for the product, this plugin computes the best possible CPE based on the information available from the scan.

Remote device type : firewall Confidence level : 70

10092 - FTP Server Detection

Synopsis

An FTP server is listening on a remote port.

Description

It is possible to obtain the banner of the remote FTP server by connecting to a remote port.

Solution

n/a

Risk Factor

None

References

XREF IAVT:0001-T-0030 XREF IAVT:0001-T-0943

Plugin Information

Published: 1999/10/12, Modified: 2023/08/17

Plugin Output

tcp/21

```
The remote FTP banner is:

220------ Welcome to Pure-FTPd [privsep] [TLS] ------
220-You are user number 2 of 50 allowed.

220-Local time is now 02:46. Server port: 21.

220-This is a private system - No anonymous login

220-IPv6 connections are also welcome on this server.

220 You will be disconnected after 15 minutes of inactivity.
```

42149 - FTP Service AUTH TLS Command Support

Synopsis

The remote directory service supports encrypting traffic.

Description

The remote FTP service supports the use of the 'AUTH TLS' command to switch from a cleartext to an encrypted communications channel.

See Also

https://en.wikipedia.org/wiki/STARTTLS

https://tools.ietf.org/html/rfc4217

Solution

n/a

Risk Factor

None

Plugin Information

Published: 2009/10/15, Modified: 2024/01/16

Plugin Output

tcp/21

The remote FTP service responded to the 'AUTH TLS' command with a '234' response code, suggesting that it supports that command. However, Nessus failed to negotiate a TLS connection or get the associated SSL certificate, perhaps because of a network connectivity problem or the service requires a peer certificate as part of the negotiation.

84502 - HSTS Missing From HTTPS Server

Synopsis

The remote web server is not enforcing HSTS.

Description

The remote HTTPS server is not enforcing HTTP Strict Transport Security (HSTS). HSTS is an optional response header that can be configured on the server to instruct the browser to only communicate via HTTPS. The lack of HSTS allows downgrade attacks, SSL-stripping man-in-the-middle attacks, and weakens cookie-hijacking protections.

See Also

https://tools.ietf.org/html/rfc6797

Solution

Configure the remote web server to use HSTS.

Risk Factor

None

Plugin Information

Published: 2015/07/02, Modified: 2021/05/19

Plugin Output

tcp/2078/www

The remote HTTPS server does not send the HTTP "Strict-Transport-Security" header.

43111 - HTTP Methods Allowed (per directory)

Synopsis

This plugin determines which HTTP methods are allowed on various CGI directories.

Description

By calling the OPTIONS method, it is possible to determine which HTTP methods are allowed on each directory.

The following HTTP methods are considered insecure:

PUT, DELETE, CONNECT, TRACE, HEAD

Many frameworks and languages treat 'HEAD' as a 'GET' request, albeit one without any body in the response. If a security constraint was set on 'GET' requests such that only 'authenticatedUsers' could access GET requests for a particular servlet or resource, it would be bypassed for the 'HEAD' version. This allowed unauthorized blind submission of any privileged GET request.

As this list may be incomplete, the plugin also tests - if 'Thorough tests' are enabled or 'Enable web applications tests' is set to 'yes'

in the scan policy - various known HTTP methods on each directory and considers them as unsupported if it receives a response code of 400, 403, 405, or 501.

Note that the plugin output is only informational and does not necessarily indicate the presence of any security vulnerabilities.

 CLIENT_FOUND_ROWS (Found instead of affected rows)
 CLIENT_LONG_FLAG (Get all column flags)
 CLIENT_CONNECT_WITH_DB (One can specify db on connect)
  CLIENT_NO_SCHEMA (Don't allow database.table.column)
  CLIENT_COMPRESS (Can use compression protocol)
 CLIENT_ODBC (ODBC client)
 CLIENT_LOCAL_FILES (Can use LOAD DATA LOCAL)
  CLIENT_IGNORE_SPACE (Ignore spaces before "(")
  CLIENT_PROTOCOL_41 (New 4.1 protocol)
  CLIENT_INTERACTIVE (This is an interactive client)
  CLIENT_SIGPIPE (IGNORE sigpipes)
 CLIENT_TRANSACTIONS (Client knows about transactions)
  CLIENT_RESERVED (Old flag for 4.1 protocol)
  CLIENT_SECURE_CONNECTION (New 4.1 authentication)
```

Synopsis

It is possible to determine which TCP ports are open.

Description

This plugin is a SYN 'half-open' port scanner. It shall be reasonably quick even against a firewalled target.

Note that SYN scans are less intrusive than TCP (full connect) scans against broken services, but they might cause problems for less robust firewalls and also leave unclosed connections on the remote target, if the network is loaded.

Solution

Protect your target with an IP filter.

Risk Factor

None

19506 - Nessus Scan Information

Synopsis

This plugin displays information about the Nessus scan.

Description

This plugin displays, for each tested host, information about the scan itself:

- The version of the plugin set.
- The type of scanner (Nessus or Nessus Home).
- The version of the Nessus Engine.
- The port scanner(s) used.
- The port range scanned.
- The ping round trip time
- Whether credentialed or third-party patch management checks are possible.
- Whether the display of superseded patches is enabled
- The date of the scan.
- The duration of the scan.
- The number of hosts scanned in parallel.
- The number of checks done in parallel.

The remote host is running CISCO PIX 7.0

117886 - OS Security Patch Assessment Not Available

Synopsis

OS Security Patch Assessment is not available.

Description

OS Security Patch Assessment is not available on the remote host.

This does not necessarily indicate a problem with the scan.

Credentials may not have been provided, OS security patch assessment may not be supported for the target, the target may not have been identified, or another issue may have occurred that prevented OS security patch assessment from being available. See plugin output for details.

This plugin reports non-failure information impacting the availability of OS Security Patch Assessment. Failure information is reported by plugin 21745: 'OS Security Patch Assessment failed'. If a target host is not supported for OS Security Patch Assessment, plugin 110695: 'OS Security Patch Assessment Checks Not Supported' will report concurrently with this plugin.

10185 - POP Server Detection

Synopsis

A POP server is listening on the remote port.

Description

The remote host is running a server that understands the Post Office Protocol (POP), used by email clients to retrieve messages from a server, possibly across a network link.

See Also

https://en.wikipedia.org/wiki/Post_Office_Protocol

Solution

Disable this service if you do not use it.

Risk Factor

None

Plugin Information

Published: 1999/10/12, Modified: 2019/11/22

Plugin Output

tcp/110/pop3

+OK Dovecot ready.

42087 - POP3 Service STLS Command Support

Synopsis

The remote mail service supports encrypting traffic.

Description

The remote POP3 service supports the use of the 'STLS' command to switch from a cleartext to an encrypted communications channel.

See Also

https://en.wikipedia.org/wiki/STARTTLS

https://tools.ietf.org/html/rfc2595

Solution

n/a

Risk Factor

None

Plugin Information

Published: 2009/10/09, Modified: 2021/02/24

Plugin Output

tcp/110/pop3

The remote POP3 service responded to the 'STLS' command with an '+OK' response code, suggesting that it supports that command. However, Nessus failed to negotiate a TLS connection or get the associated SSL certificate, perhaps because of a network connectivity problem or the service requires a peer certificate as part of the negotiation.

40665 - Protected Web Page Detection

Synopsis

Some web pages require authentication.

Description

The remote web server requires HTTP authentication for the following pages. Several authentication schemes are available:

- Basic is the simplest, but the credentials are sent in cleartext.
- NTLM provides an SSO in a Microsoft environment, but it cannot be used on both the proxy and the web server. It is also weaker than Digest.
- Digest is a cryptographically strong scheme. Credentials are never sent in cleartext, although they may still

be cracked by a dictionary attack.	·	J	,	,

10263 - SMTP Server Detection

Synopsis

An SMTP server is listening on the remote port.

Description

The remote host is running a mail (SMTP) server on this port.

Since SMTP servers are the targets of spammers, it is recommended you disable it if you do not use it.

Solution

Disable this service if you do not use it, or filter incoming traffic to this port.

Risk Factor

None

153588 - SSH SHA-1 HMAC Algorithms Enabled

Synopsis

The remote SSH server is configured to enable SHA-1 HMAC algorithms.

Description

The remote SSH server is configured to enable SHA-1 HMAC algorithms.

Although NIST has formally deprecated use of SHA-1 for digital signatures, SHA-1 is still considered secure for HMAC as the security of HMAC does not rely on the underlying hash function being resistant to collisions.

Note that this plugin only checks for the options of the remote SSH server.

10863 - SSL Certificate Information

Synopsis

This plugin displays the SSL certificate.

Description

This plugin connects to every SSL-related port and attempts to extract and dump the X.509 certificate.

Solution

n/a

Risk Factor

None

Plugin Information

Published: 2008/05/19, Modified: 2021/02/03

Plugin Output

tcp/143/imap

```

95631 - SSL Certificate Signed Using Weak Hashing Algorithm (Known CA)

Synopsis

A known CA SSL certificate in the certificate chain has been signed using a weak hashing algorithm.

Description

The remote service uses a known CA certificate in the SSL certificate chain that has been signed using a cryptographically weak hashing algorithm (e.g., MD2, MD4, MD5, or SHA1). These signature algorithms are known to be vulnerable to collision attacks (CVE-2004-2761, for example). An attacker can exploit this to generate another certificate with the same digital signature, allowing the attacker to masquerade as the affected service.

Note that this plugin reports all SSL certificate chains signed with SHA-1 that expire after January 1, 2017 as vulnerable. This is in accordance with Google's gradual sunsetting of the SHA-1 cryptographic hash algorithm.

Note that this plugin will only fire on root certificates that are known certificate authorities as listed in Tenable Community Knowledge Article 000001752. That is what differentiates this plugin from plugin 35291, which will fire on any certificate, not just known certificate authority root certificates.

Known certificate authority root certificates are inherently trusted and so any potential issues with the signature, including it being signed using a weak hashing algorithm, are not considered security issues.

http://www.nessus.org/u?9bb87bf2

Solution

Contact the Certificate Authority to have the certificate reissued.

Risk Factor

None

95631 - SSL Certificate Signed Using Weak Hashing Algorithm (Known CA)

Synopsis

A known CA SSL certificate in the certificate chain has been signed using a weak hashing algorithm.

Description

The remote service uses a known CA certificate in the SSL certificate chain that has been signed using a cryptographically weak hashing algorithm (e.g., MD2, MD4, MD5, or SHA1). These signature algorithms are known to be vulnerable to collision attacks (CVE-2004-2761, for example). An attacker can exploit this to generate another certificate with the same digital signature, allowing the attacker to masquerade as the affected service.

Note that this plugin reports all SSL certificate chains signed with SHA-1 that expire after January 1, 2017 as vulnerable. This is in accordance with Google's gradual sunsetting of the SHA-1 cryptographic hash algorithm.

Note that this plugin will only fire on root certificates that are known certificate authorities as listed in Tenable Community Knowledge Article 000001752. That is what differentiates this plugin from plugin 35291, which will fire on any certificate, not just known certificate authority root certificates.

Known certificate authority root certificates are inherently trusted and so any potential issues with the signature, including it being signed using a weak hashing algorithm, are not considered security issues.

95631 - SSL Certificate Signed Using Weak Hashing Algorithm (Known CA)

Synopsis

A known CA SSL certificate in the certificate chain has been signed using a weak hashing algorithm.

Description

The remote service uses a known CA certificate in the SSL certificate chain that has been signed using a cryptographically weak hashing algorithm (e.g., MD2, MD4, MD5, or SHA1). These signature algorithms are known to be vulnerable to collision attacks (CVE-2004-2761, for example). An attacker can exploit this to generate another certificate with the same digital signature, allowing the attacker to masquerade as the affected service.

Note that this plugin reports all SSL certificate chains signed with SHA-1 that expire after January 1, 2017 as vulnerable. This is in accordance with Google's gradual sunsetting of the SHA-1 cryptographic hash algorithm.

Note that this plugin will only fire on root certificates that are known certificate authorities as listed in Tenable Community Knowledge Article 000001752. That is what differentiates this plugin from plugin 35291, which will fire on any certificate, not just known certificate authority root certificates.

Known certificate authority root certificates are inherently trusted and so any potential issues with the signature, including it being signed using a weak hashing algorithm, are not considered security issues.

95631 - SSL Certificate Signed Using Weak Hashing Algorithm (Known CA)

Synopsis

A known CA SSL certificate in the certificate chain has been signed using a weak hashing algorithm.

Description

The remote service uses a known CA certificate in the SSL certificate chain that has been signed using a cryptographically weak hashing algorithm (e.g., MD2, MD4, MD5, or SHA1). These signature algorithms are known to be vulnerable to collision attacks (CVE-2004-2761, for example). An attacker can exploit this to generate another certificate with the same digital signature, allowing the attacker to masquerade as the affected service.

Note that this plugin reports all SSL certificate chains signed with SHA-1 that expire after January 1, 2017 as vulnerable. This is in accordance with Google's gradual sunsetting of the SHA-1 cryptographic hash algorithm.

Note that this plugin will only fire on root certificates that are known certificate authorities as listed in Tenable Community Knowledge Article 000001752. That is what differentiates this plugin from plugin 35291, which will fire on any certificate, not just known certificate authority root certificates.

Known certificate authority root certificates are inherently trusted and so any potential issues with the signature, including it being signed using a weak hashing algorithm, are not considered security issues.

http://www.nessus.org/u?9bb87bf2

Solution

Contact the Certificate Authority to have the certificate reissued.

Risk Factor

None

```
The following known CA certificates were part of the certificate
chain sent by the remote host, but contain hashes that are considered
to be weak.

70544 - SSL Cipher Block Chaining Cipher Suites Supported

Synopsis

The remote service supports the use of SSL Cipher Block Chaining ciphers, which combine previous blocks with subsequent ones.

Description

The remote host supports the use of SSL ciphers that operate in Cipher Block Chaining (CBC) mode. These cipher suites offer additional security over Electronic Codebook (ECB) mode, but have the potential to leak information if used improperly.

Note that this service does not encrypt traffic by default but does support upgrading to an encrypted connection using STARTTLS.

21643 - SSL Cipher Suites Supported

Synopsis

The remote service encrypts communications using SSL.

Description

This plugin detects which SSL ciphers are supported by the remote service for encrypting communications.

57041 - SSL Perfect Forward Secrecy Cipher Suites Supported

Synopsis

The remote service supports the use of SSL Perfect Forward Secrecy ciphers, which maintain confidentiality even if the key is stolen.

Description

The remote host supports the use of SSL ciphers that offer Perfect Forward Secrecy (PFS) encryption. These cipher suites ensure that recorded SSL traffic cannot be broken at a future date if the server's private key is compromised.

57041 - SSL Perfect Forward Secrecy Cipher Suites Supported

Synopsis

The remote service supports the use of SSL Perfect Forward Secrecy ciphers, which maintain confidentiality even if the key is stolen.

Description

The remote host supports the use of SSL ciphers that offer Perfect Forward Secrecy (PFS) encryption. These cipher suites ensure that recorded SSL traffic cannot be broken at a future date if the server's private key is compromised.

156899 - SSL/TLS Recommended Cipher Suites

Synopsis

The remote host advertises discouraged SSL/TLS ciphers.

Description

The remote host has open SSL/TLS ports which advertise discouraged cipher suites. It is recommended to only enable support for the following cipher suites:

TLSv1.3:

- 0x13,0x01 TLS13_AES_128_GCM_SHA256
- 0x13,0x02 TLS13_AES_256_GCM_SHA384
- 0x13,0x03 TLS13 CHACHA20 POLY1305 SHA256

TLSv1.2:

- 0xC0,0x2B ECDHE-ECDSA-AES128-GCM-SHA256
- 0xC0,0x2F ECDHE-RSA-AES128-GCM-SHA256
- 0xC0,0x2C ECDHE-ECDSA-AES256-GCM-SHA384
- 0xC0,0x30 ECDHE-RSA-AES256-GCM-SHA384
- 0xCC,0xA9 ECDHE-ECDSA-CHACHA20-POLY1305
- 0xCC,0xA8 ECDHE-RSA-CHACHA20-POLY1305

This is the recommended configuration for the vast majority of services, as it is highly secure and compatible with nearly every client released in the last five (or more) years.

110723 - Target Credential Status by Authentication Protocol - No Credentials Provided

Synopsis

Nessus was able to find common ports used for local checks, however, no credentials were provided in the scan policy.

Description

Nessus was not able to successfully authenticate directly to the remote target on an available authentication protocol. Nessus was able to connect to the remote port and identify that the service running on the port supports an authentication protocol, but Nessus failed to authenticate to the remote service using the provided credentials. There may have been a protocol failure that prevented authentication from being attempted or all of the provided credentials for the authentication protocol may be invalid. See plugin output for error details.

Please note the following:

- This plugin reports per protocol, so it is possible for valid credentials to be provided for one protocol and not another. For example, authentication may succeed via SSH but fail via SMB, while no credentials were provided for an available SNMP service.
- Providing valid credentials for all available authentication protocols may improve scan coverage, but the value of successful authentication for a given protocol may vary from target to target depending upon what data (if any) is gathered from the target via that protocol. For example, successful authentication via SSH is more valuable for Linux targets than for Windows targets, and likewise successful authentication via SMB is more valuable for Windows targets than for Linux targets.

51080 - Web Server Uses Basic Authentication over HTTPS

Synopsis

The remote web server seems to transmit credentials using Basic Authentication.

Description

The remote web server contains web pages that are protected by 'Basic' authentication over HTTPS.

While this is not in itself a security flaw, in some organizations, the use of 'Basic' authentication is discouraged as, depending on the underlying implementation, it may be vulnerable to account brute-forcing or may encourage Man-in-The-Middle (MiTM) attacks.

Solution

Make sure that the use of HTTP 'Basic' authentication is in line with your organization's security policy.

Risk Factor

None

Plugin Information

Published: 2010/12/08, Modified: 2011/03/18

Plugin Output

tcp/2078/www

The following pages are protected :

/:/ realm="Restricted Area"

11424 - WebDAV Detection

Synopsis

The remote server is running with WebDAV enabled.

Description

WebDAV is an industry standard extension to the HTTP specification.

It adds a capability for authorized users to remotely add and manage the content of a web server.

If you do not use this extension, you should disable it.

Solution

http://support.microsoft.com/default.aspx?kbid=241520

Risk Factor

None

Plugin Information
